SLEEVE ATTACHING MACHINE

Belt feeding

Independent left and right feeding that prevents material slippage.

Mechanism for the movement of the feeding belt and an alternating up and down movement of the presser foot, which eliminates both creases in the armhole and irregular curls that can occur in the upper sector of the sleeve.

With the introduction of belt feeding, the risk of stretching the fabric caused by feeding has been eliminated.

Touch Screen

3 sewing modes: manual in which the curl is activated with the pedal, semi-automatic in which the curl is activated digitally with the electronic kneepad and programmed in which the curl takes over after the selected number of stitches.

Furthermore, it is possible to divide the armhole into sections with different curl and thread tension in relation to the looseness of the fabric and stitch length.

Specs

Model	2100
Stitch length above and below	1.5-6.0 mm
Max speed	3.500rpm
Needle bar stroke	30.7mm
Presser foot lifter height	5.5/10mm
Application	Sleeve
